File: Project-AmadeusTravelAPI-Flights.ipynb

Name: Corinne Medeiros

Date: 02/29/20

Description: Program pulls flight data from the Amadeus Travel API, stores it in a Pandas dataframe, cleans up headers and columns, and saves the dataframe to a CSV file.

In [133…
```python
import pandas as pd
import requests
import json
```

Exploring Flight Options with Amadeus Travel API

In [134…
```python
from amadeus import Client, ResponseError

# Initializing Amadeus library using my credentials
amadeus = Client(
    client_id='ASGeALuDm6zEXAYoquO6ZmGcPHLHWDDj',
    client_secret='AuiUr1fS5Af9UfD0'
)
```

(photo courtesty of Amadeus Travel API: https://developers.amadeus.com/PAS-EAS/api/v1/cms-gateway//sites/default/files/styles/image_homepage_crop/public/2020-02/Airplane%20takeoff%20at%20Rio%20de%20Janeiro.jpg?h=8dab17aa&itok=nEPMsFAH)

Scenario

I'm interested in visiting Los Angeles this summer on July 9th. I'm pulling data from the Amadeus Travel API (https://developers.amadeus.com/) to see what my flight options are.

Initial Data Pull

In [141…
```python
try:
    '''
    What are the flight options for flying to Los Angeles from San Francisco on July 9th, 2020?
    '''
    response = amadeus.shopping.flight_offers.get(origin='SFO', destination='LAX', departureDate='20

    print(response.data)

except ResponseError as error:
    print(error)
```

Visualizing Data Structure

Since the above data response is very nested and hard to visualize, I pasted the response into a JSON formatter (https://jsonformatter.curiousconcept.com/) to see the structure and grab the specific data I wanted.

Here is an example of one formatted entry to visualize the data structure:

```
{ ⊟
    "type":"flight-offer",
    "id":"1583005516650-988784424",
    "offerItems":[ ⊟
        { ⊟
            "services":[ ⊟
                { ⊟
                    "segments":[ ⊟
                        { ⊟
                            "flightSegment":{ ⊟
                                "departure":{ ⊟
                                    "iataCode":"SFO",
                                    "terminal":"2",
                                    "at":"2020-07-09T19:00:00-07:00"
                                },
                                "arrival":{ ⊟
                                    "iataCode":"LAX",
                                    "terminal":"6",
                                    "at":"2020-07-09T20:33:00-07:00"
                                },
                                "carrierCode":"AS",
                                "number":"1238",
                                "aircraft":{ ⊟
                                    "code":"32S"
                                },
                                "operating":{ ⊟
                                    "carrierCode":"AS",
                                    "number":"1238"
                                },
                                "duration":"0DT1H33M"
                            },
                            "pricingDetailPerAdult":{ ⊟
                                "travelClass":"ECONOMY",
                                "fareClass":"X",
                                "availability":7,
                                "fareBasis":"TH2OAVBN"
                            }
                        }
                    ]
                }
            ],
            "price":{ ⊟
                "total":"63.85",
                "totalTaxes":"16.85"
```

Pulling and Storing Specific Data

Now, with a better understanding of the structure, I can pull specific variables using a key or an index.

```
In [135…    # Creating an empty Pandas dataframe to store flight data
            flightsdf = pd.DataFrame(columns=['flight_id'])

            try:
                '''
                What are the flight options for flying to Los Angeles from San Francisco on July 9th, 2020?
```

```python
        '''
        response = amadeus.shopping.flight_offers.get(origin='SFO', destination='LAX', departureDate='20

        # Looping through response, adding each variable to Pandas dataframe
        for r in response.data:

            flightsdf = flightsdf.append({'flight_id': r['id'],
                                          'total':  r['offerItems'][0]['price']['total'],
                                          'totalTaxes': r['offerItems'][0]['price']['totalTaxes'],
                                          'departure_port': r['offerItems'][0]['services'][0]['segments'
                                          'arrival_port': r['offerItems'][0]['services'][0]['segments'][
                                          'd_time': r['offerItems'][0]['services'][0]['segments'][0]['fl
                                          'a_time': r['offerItems'][0]['services'][0]['segments'][0]['fl
                                          'd_fl_num': r['offerItems'][0]['services'][0]['segments'][0]['
                                          'carrier': r['offerItems'][0]['services'][0]['segments'][0]['f
                                          'duration': r['offerItems'][0]['services'][0]['segments'][0]['
                                          'class': r['offerItems'][0]['services'][0]['segments'][0]['pri
                                          'availability': r['offerItems'][0]['services'][0]['segments'][
                                          'aircraft_code': r['offerItems'][0]['services'][0]['segments']
                                          'fare_class': r['offerItems'][0]['services'][0]['segments'][0]

                                         },
                                         ignore_index=True)

    except ResponseError as error:
        print(error)

print(flightsdf)
```

Dataframe Clean Up

Our arrival time and departure time columns include a date and a time. It would make more sense to have this info split into two variables in separate columns.

I'll use string methods and Pandas to split them at "T" and then store them in separate columns.

```
# New arrival time data frame with split value columns
a_time_df = flightsdf["a_time"].str.split("T", n = 1, expand = True)

# Making separate date column from new data frame
flightsdf["a_date"]= a_time_df[0]

# Making separate time column from new data frame
flightsdf["a_time_new"]= a_time_df[1]

# Dropping old time column
flightsdf.drop(columns =["a_time"], inplace = True)

# Previewing cleaned data
print(flightsdf.head())
```

```

```

Now that I have them successfully separated, I'll clean up those column names.

```python
flightsdf=flightsdf.rename(columns = {'a_time_new':'arr_time', 'd_time_new':'dep_time', 'a_date':'ar

print(flightsdf.head())
```

```
                 flight_id aircraft_code arrival_port  availability carrier  \

```

The duration column could also use some cleaning. Since none of the flights are longer than a day, I'll strip the data to only include hours and minutes.

```python
# New duration data frame with stripped values
dur_df = flightsdf["duration"].str.split("T", n = 1, expand = True)

# Making new duration column from new data frame
flightsdf["duration_new"]= dur_df[1]

# Dropping old duration column
flightsdf.drop(columns =["duration"], inplace = True)
```

```
# Renaming cleaned duration column
flightsdf=flightsdf.rename(columns = {'duration_new':'duration'})

# Previewing cleaned data
print(flightsdf.head())
```

```

In [129…

```
# Writing cleaned dataframe to CSV file
flightsdf.to_csv('flights_sfo_lax_07092020.csv')
```

With the CSV file successfully created, I feel great!
